

Contractor profile

Sandwich panel installation for general contractors and industrial clients across Europe.

Team experience since 2010

800,000 m² of combined team experience, including work before the current company was formed. Four crews; composition and availability are confirmed for each project.

What we install

External and internal walls, sandwich panel roofs, cold store and freezer enclosures, facade cladding and related flashings. Cleanroom and IT area enclosures: scope agreed after reviewing documentation, with clearly allocated responsibilities.

Where we work

Across Europe. We discuss projects in countries including the Netherlands, Germany, Austria, Belgium and Poland. Service coverage does not mean we have completed a project in every country.

How we agree the work

Documentation and quantities → scope and quotation → planning and logistics → installation → inspection and reporting → handover. Before starting, we agree decision-makers, responsibilities, dates, change procedures and payment terms.

Scope boundaries

The client normally provides materials, the prepared structure and access equipment. This is not a general contracting offer. Refrigeration, HVAC, IT, power supply, cleanroom validation and structural calculations are not included simply by ordering the enclosure installation.

Prequalification documents

We agree company documents, insurance and host-country requirements. A1, VCA and qualifications are checked for the assigned people and project dates. Our website describes the July 2026 KingZip SF training and shows the original certificate; it does not replace qualification of the complete building.

Send the location, scope and dates

Include drawings, quantities and access conditions. Price, scope and availability are confirmed individually.
